Using Shared Data collection in large classes

Physics introductory classes Jennifer Weinberg-Wolf Duane Deardorff

The problem - limited class time for high quality data collection of interesting problems

The solution - share data collection

- Maintain high quality data
- Cover more (directions, situations, geometries, etc.)
- Collect more (larger N)
- Fix data on the spot (students learn in real time from each other)
- Efficient with limited time

Maintain High Quality Data (B-Field measurements)

Cover more scenarios (Diffraction)

- Limited class time BUT many possible parameters to investigate
 - Number of slits
 - Slit spacing
 - Slit width
 - Wavelength of light
- Within 45 minutes of data collection, a class can generate data for 27 different experimental combinations this would be impossible without sharing data!
- Reduce "busy work" of repeated, similar measurements
- Standardized spreadsheet ensures relevant data is collected

Collect more data (Probability)

Fix errors (work and energy lab activity)

Students and instructors can see collective results in real time, notice errors/outliers, and correct mistakes that might have been overlooked.

The following screen shots are from two different lab sections of Physics 104 on a single day - note time and date in lower right corner.

Notice in particular section 411 from 12:05 to 12:22 (last two slides), how the students in row 6 changed their numbers to reduce the relative energy loss from 70.5% to 27.2%, which made their results consistent with other groups.
